

Whole soybeans

- Good source of protein for growing diets
- Fat is the limiting factor: Introduce animals slowly to feed, then gradually increased

Feeding Considerations

- Higher than 15% of total ration dry matter can lead to scouring, acidosis, and overall decreased performance
- DO NOT feed whole soybeans with urea or other non-protein nitrogen sources – can lead to urea toxicity
- WATCH OUT for soybeans treated with many herbicides- check the label to see if there are feeding restrictions.

On average:
90% dry matter
91% TDN
42% CP
20% fat
