

Soybean Project Summary, 2008

TITLE: New Soybean Inoculants for Alabama

INVESTIGATORS:

Dennis Delaney and Yucheng Feng
Extension Specialist and Associate Professor, respectively
Dept. of Agronomy & Soils, Auburn University

SUMMARY:

Experiments were conducted at three Experiment Stations in Alabama in 2008 to determine if soybean seed inoculation by rhizobia bacteria (*Bradyrhizobium japonica*) could increase growth or yields. Two of these fields had no recent history of soybean production. Although there were differences in yield between some treatments at one location, inoculation did not statistically increase nodule count or soybean yield compared to untreated at any location.
