**Strobilurin-Resistant Frog Eye Leaf Spot**

If you come across frog eye leaf spot in a field this year, please consider collecting a sample so that we can check for fungicide resistance.

We have detected resistance in 5 counties so far including Morgan, Blount, Limestone, Pickens and Escambia. We would like to see how widespread a problem this is in Alabama.

To send leaves please follow the protocol below:

1. Collect about 20-50 leaflets that are exhibiting frogeye leaf spot symptoms. Place them in a sealed plastic bag (ziplock) and ship them over night to the Diagnostic lab in Auburn. Having fresh samples is very important for us to obtain good results.

   Plant Diagnostic Lab
   ALFA Agricultural Services
   & Research Building
   961 South Donahue Drive
   Auburn, AL 36849-5624

2. Record as much of the following information as possible and send along with the sample:
   a. Your name and contact information
   b. County in which leaves were collected
   c. Field identifier – anything (name, number, etc.) that will help identify the field when we report the information back to you
   d. Was a fungicide applied to this field? If so, what fungicide and rate?
   e. What is the soybean variety?
