

Radon Kits Available

Radon is a naturally occurring gas that seeps from the ground in certain areas of the state depending on the geology of the soils. This colorless and odorless gas has been proven to increase the risk of lung cancer. Out in the open air it is of little concern as it dissipates quickly, however when it seeps up under and into a tightly sealed home, the levels can become high enough to be of concern. Homes should not have radon levels of more than 4 picocuries per liter of air. If you would like to have your home tested, the Coosa County Extension Office has test kits available for \$10 each. Please let us know if you need additional information.
