Japanese honeysuckle \((Lonicera japonica)\)

- Japanese honeysuckle is the most common non-native plant in Alabama.
- A semi-evergreen to evergreen woody vine, it has opposite leaves and fragrant white flowers.
- Spread by bird and animal-dispersed seed, and by trailing vines that root at the nodes.
- Infestations inhibit understory plants and regeneration of native trees.
- Invades urban areas, stream banks, roadsides, right-of-ways, forest edges and forest interiors.
